ABSTRACT OF THE DISCLOSURE

A technology for easily and accurately identifying a counterfeit program is provided. Image data and productname data, which serve as product data, are input. A
determination is made as to whether or not the input product
data includes a registered trademark that is attached to
genuine products and that is not attached to third party
products as first information, and a determination is made
as to whether or not the input product data includes a micro
character that is attached to only genuine products as
second information for counterfeit protection. When the
input product data includes the first information and does
not include the second information, it is determined that
the product is a counterfeit product.
